Counting – Product Rule

– Suppose a procedure can be broken down into a sequence of two tasks. If there are \( n_1 \) ways to do the first task and \( n_2 \) ways to do the second task, then there are \( n_1 \times n_2 \) ways to do the procedure.

\[
|A \times B| = |A| \times |B|
\]

If \( A \) and \( B \) are finite sets, the number of elements in the Cartesian product of the sets is product of the number of elements in each set.
Counting – Sum Rule

If a task can be done either in one of \( n_1 \) ways or in one of \( n_2 \) ways, where none of the \( n_1 \) ways is the same as any of the set of \( n_2 \) ways, then there are \( n_1 + n_2 \) ways to do the task.

If \( A \) and \( B \) are disjoint sets then

\[
|A \cup B| = |A| + |B|
\]
Suppose you have 4 shirts, 3 pairs of pants, and 2 pairs of shoes. How many different outfits do you have?
Product Rule

How many functions are there from set A to set B?

To define each function we have to make 3 choices, one for each element of A.

4  4  4

How many ways can each choice be made?

64
Product Rule

How many one-to-one functions are there from set A to set B?

To define each function we have to make 3 choices, one for each element of A.

4 3 2

How many ways can each choice be made?

24
Counting

- Suppose a student can choose a computer project from one of three lists
  - List A – 23 projects
  - List B – 15 projects
  - List C – 19 projects

- No project is on more than one list

- How many possible projects are there to choose from?
  - Just count them up
  - $23 + 15 + 19 = 57$
Suppose you have 4 shirts, 3 pairs of pants, and 2 pairs of shoes. How many different outfits do you have?
Decision Tree

How many different best of 5 game series were possible between the Cubs and the Dodgers?

A DT is a good model for a sequence of events. It assists in counting, and can help you see special structure in the problem.

20
Inclusion Exclusion Principle

If a task can be done either in one of \( n_1 \) ways or in one of \( n_2 \) ways, but some of the \( n_1 \) ways are the same as some of the \( n_2 \) ways.

Are there \( n_1 + n_2 \) ways to do the task now?

- If sets A and B are NOT disjoint
  
  \[ |A \cup B| = |A| + |B| - |A \cap B| \]
Example

Count the number of bit strings of length 4 which begin with a 1 or end with 00

How many bit strings of length 4 begin with a 1?
• $2^3 = 8$

How many bit strings end in 00?
• $2^2 = 4$

So the total is $8 + 4 = 12$?

How many bit strings end in 00 and start with 1?
• 2

The real total is $8 + 4 - 2 = 10$
Pigeonhole Principle

If $n$ pigeons fly into $k$ pigeonholes and $k < n$, then some pigeonhole contains at least two pigeons.
Pigeonhole Principle

If \( n \) pigeons fly into \( k \) pigeonholes and \( k < n \), then some pigeonhole contains at least two pigeons.

We can use this simple little fact to prove amazingly complex things.
Let S contain any 6 positive integers. Then, there is a pair of numbers in S whose difference is divisible by 5.

Let \( S = \{a_1, a_2, a_3, a_4, a_5, a_6\} \). Each of these has a remainder when divided by 5. What can these remainders be?

6 numbers, 5 possible remainders...what do we know?

Consider that pair, \( a_i \) and \( a_j \), and their remainder \( r \).

\[
\begin{align*}
  a_i &= 5m + r, \\
  a_j &= 5n + r.
\end{align*}
\]

Their difference: \( a_i - a_j = (5m + r) - (5n + r) = 5m - 5n = 5(m-n) \), which is divisible by 5.
Pigeonhole Principle

Six people go to a party. Either there is a group of 3 who all know each other, or there is a group of 3 who are all strangers.

Consider one person.

She either knows or doesn’t know each other person.

But there are 5 other people! So, she knows, or doesn’t know, at least 3 others.

Let’s say she knows 3 others.

If any of those 3 know each other, we have a blue $\triangle$, which means 3 people know each other. If not, then those 3 people must be strangers.

But then we’ve proven our conjecture for this case.

The case where she doesn’t know 3 others is similar.
Extra Examples
Extra Examples

In questions below suppose that a “word” is any string of seven letters of the alphabet, with repeated letters allowed.

1) How many words are there?

2) How many words end with the letter T?

3) How many words begin with R and end with T?

4) How many words begin with A or B?

5) How many words begin with A or end with B?

6) How many words begin with A or B and end with A or B?
Extra Examples Solutions

In questions below suppose that a “word” is any string of seven letters of the alphabet, with repeated letters allowed.

1) How many words are there? \(26^7\)

2) How many words end with the letter T? \(26^6\)

3) How many words begin with R and end with T? \(26^5\)

4) How many words begin with A or B? \(2 \times 26^6\)

5) How many words begin with A or end with B? 
   \(26^6 + 26^6 - 26^5\)

6) How many words begin with A or B and end with A or B? 
   \(4 \times 26^5\)
Permutations

A permutation is an ordered arrangement of elements from a set.

On ordered arrangement of $r$ elements of a set is called an $r$-permutation.

The number of $r$-permutations of a set with $n$ elements is $P(n,r)$.

If $n$ and $r$ are integers with $0 \leq r \leq n$, then $P(n,r) = \frac{n!}{(n-r)!}$.
Permutations

In a running race of 12 sprinters, each of the top 5 finishers receives a different medal.

How many ways are there to award the 5 medals?

\[ P(n,r) = \frac{n!}{(n-r)!} \]

- a) 60
- b) 12^5
- c) 12!/7!
- d) 5^{12}
- e) No clue

Permutations

Suppose you have time to listen to 10 songs on your daily jog around campus. There are 6 Cold War Kids tunes, 8 Iggy Pop tunes, and 3 Velvet Underground tunes to choose from.

How many different jog playlists can you make?

P(17,10)
Permutations

Suppose you have time to listen to 10 songs on your daily jog around campus. There are 6 Cold War Kids tunes, 8 Iggy Pop tunes, and 3 Velvet Underground tunes to choose from.

Now suppose you want to listen to 4 Cold War Kids, 4 Iggy Pop, and 2 Velvet Underground tunes, in that band order. How many playlists can you make?

\[ P(6,4) \times P(8,4) \times P(3,2) \]
Permutations

Suppose you have time to listen to 10 songs on your daily jog around campus. There are 6 Cold War Kids tunes, 8 Iggy Pop tunes, and 3 Velvet Underground tunes to choose from.

Finally, suppose you still want 4 Cold War Kids, 4 Iggy Pop, and 2 Velvet Underground tunes, and the order of the groups does not matter, but you get dizzy and fall down if all the songs by any one group are not played together.

How many playlists are there now?

\[ P(6,4) \times P(8,4) \times P(3,2) \times 3! \]
Permutations

In how many ways can 5 distinct Martians and 3 distinct Jovians stand in line, if no two Jovians stand together?

\[ 5! \times P(6,3) \]
Combinations

A combination is an unordered selection of elements from some set.

The number of combinations of \( r \) distinct objects chosen from \( n \) distinct objects is denoted by \( C(n,r) \) or \( nCr \), and is read “n choose r.”

\[
C(n,r) = \frac{P(n,r)}{r!} = \frac{n!}{((n-r)!r!)}
\]
Combinations

A basketball squad consists of 12 players, 5 of which make up a team. How many different teams of players can you make from the 12?

What’s the difference?

In a running race of 12 sprinters, each of the top 5 finishers receives a different medal. How many ways are there to award the 5 medals?

\[ C(12,5) \]

\[ P(12,5) = C(12,5) \times 5! \]
Combinations

A committee of 3 students is to be selected from a class consisting of 4 freshmen, and 5 sophomores.

In how many ways can a committee with at most 1 freshman be selected?

Start with a easier question first...

What is the total number of possible combinations to select a committee of 3 students?

Universe = C(9,3) = 84
Combinations

Universe  = C(9,3) = 84

<table>

Total Combinations  = 84

In how many ways can a committee with at most 1 freshman be selected? 10 + 40 = 50
In how many ways can a committee with at least 1 freshman be selected? 40 + 30 + 4 = 74
A committee of 8 students is to be selected from a class consisting of 19 freshmen, and 34 sophomores.

In how many ways can 3 freshmen and 5 sophomores be selected?

\[ C(19,3) \times C(34,5) \]
Combinations

A committee of 8 students is to be selected from a class consisting of 19 freshmen, and 34 sophomores.

In how many ways can a committee with exactly 1 freshman be selected?

\[ C(19,1) \times C(34,7) \]
A committee of 8 students is to be selected from a class consisting of 19 freshmen, and 34 sophomores.

In how many ways can a committee with at most 1 freshman be selected?

Break it into cases:
\[ C(34,8) \times C(19,0) + C(34,7) \times C(19,1) = (18,156,204 \times 1) + (5379616 \times 19) \]
\[ = 120,368,908 \]
