26-2

Random-Number Generation

- \square Random Number = Uniform (0, 1)
- □ Random Variate = Other distributions
 - = Function(Random number)

A Sample Generator

$$x_n = f(x_{n-1}, x_{n-2}, \ldots)$$

□ For example,

$$x_n = 5x_{n-1} + 1 \mod 16$$

□ Starting with $x_0=5$:

$$x_1 = 5(5) + 1 \mod 16 = 26 \mod 16 = 10$$

- □ The first 32 numbers obtained by the above procedure 10, 3, 0, 1, 6, 15, 12, 13, 2, 11, 8, 9, 14, 7, 4, 5 10, 3, 0, 1, 6, 15, 12, 13, 2, 11, 8, 9, 14, 7, 4, 5.
- By dividing x's by 16: 0.6250, 0.1875, 0.0000, 0.0625, 0.3750, 0.9375, 0.7500, 0.8125, 0.1250, 0.6875, 0.5000, 0.5625, 0.8750, 0.4375, 0.2500, 0.3125, 0.6250, 0.1875, 0.0000, 0.0625, 0.3750, 0.9375, 0.7500, 0.8125, 0.1250, 0.6875, 0.5000, 0.5625, 0.8750, 0.4375, 0.2500, 0.3125.

Terminology

- \square Seed = x_0
- □ **Pseudo-Random**: Deterministic yet would pass randomness tests
- □ Fully Random: Not repeatable
- □ Cycle length, Tail, Period

26-5

Properties of a Good Generator

- ☐ It should be efficiently computable.
- ☐ The period should be large.
- ☐ The successive values should be independent and uniformly distributed

Washington University in St. Louis

http://www.cse.wustl.edu/~jain/cse567-17/

•

26-6

Types of Generators

- ☐ Linear congruential generators
- □ Tausworthe generators
- □ Extended Fibonacci generators
- □ Combined generators

Linear-Congruential Generators

- Discovered by D. H. Lehmer in 1951
- ☐ The residues of successive powers of a number have good randomness properties.

$$x_n = a^n \mod m$$

Equivalently,

$$x_n = ax_{n-1} \mod m$$

a = multiplier

m = modulus

versity in St. Louis http://www.cse.wustl.edu/~jain/cse567-17/

Washington University in St. Louis

http://www.cse.wustl.edu/~iain/cse567-17

©2017 Raj Jaj

LCG (Cont)

- Lehmer's choices: a = 23 and $m = 10^{8}+1$
- □ Good for ENIAC, an 8-digit decimal machine.
- □ Generalization:

$$x_n = ax_{n-1} + b \bmod m$$

- □ Can be analyzed easily using the theory of congruences
 - ⇒ Mixed Linear-Congruential Generators or Linear-Congruential Generators (LCG)
- \square Mixed = both multiplication by a and addition of b

Washington University in St. Louis

http://www.cse.wustl.edu/~jain/cse567-17

©2017 Raj Jair

26-9

LCG Parameters (Cont)

- ☐ If *b* is nonzero, the maximum possible period *m* is obtained if and only if:
- Integers m and b are relatively prime, that is, have no common factors other than 1.
- \triangleright Every prime number that is a factor of *m* is also a factor of *a*-1.
- ▶ If integer m is a multiple of 4, a-1 should be a multiple of 4.
- Notice that all of these conditions are met if $m=2^k$, a=4c+1, and b is odd. Here, c, b, and k are positive integers.

Selection of LCG Parameters

- \Box a, b, and m affect the period and autocorrelation
- \Box The modulus *m* should be large.
- \Box The period can never be more than m.
- □ For mod m computation to be efficient, m should be a power of $2 \Rightarrow \text{Mod } m$ can be obtained by truncation.

Washington University in St. Louis

http://www.cse.wustl.edu/~jain/cse567-17/

©2017 Rai Jain

26-10

Period vs. Autocorrelation

□ A generator that has the maximum possible period is called a full-period generator.

$$x_n = (2^{34} + 1)x_{n-1} + 1 \mod 2^{35}$$

$$x_n = (2^{18} + 1)x_{n-1} + 1 \mod 2^{35}$$

- Lower autocorrelations between successive numbers are preferable.
- Both generators have the same full period, but the first one has a correlation of 0.25 between x_{n-1} and x_n , whereas the second one has a negligible correlation of less than 2^{-18}

Washington University in St. Louis

26-11

Multiplicative LCG

■ Multiplicative LCG: *b*=0

$$x_n = ax_{n-1} \mod m$$

☐ Two types:

$$m=2^k$$

$$m \neq 2^k$$

Washington University in St. Louis

http://www.cse.wustl.edu/~jain/cse567-17

©2017 Raj Jai

26-13

Example 26.1a

$$x_n = 5x_{n-1} \bmod 2^5$$

□ Using a seed of x_0 =1:

Period =
$$8 = 32/4$$

■ With $x_0 = 2$, the sequence is: 10, 18, 26, 2, 10,... Here, the period is only 4.

Multiplicative LCG with m=2k

- $□ m = 2^k \Rightarrow \text{trivial division}$ $⇒ \text{Maximum possible period } 2^{k-2}$
- □ Period achieved if multiplier a is of the form $8i\pm 3$, and the initial seed is an odd integer
- □ One-fourth the maximum possible may not be too small
- □ Low order bits of random numbers obtained using LCG's with $m=2^k$ have a cyclic pattern

Washington University in St. Louis

http://www.cse.wustl.edu/~jain/cse567-17/

©2017 Rai Jai

26-14

Example 26.1b

 \square Multiplier not of the form 8i \pm 3:

$$x_n = 7x_{n-1} \mod 2^5$$

- Using a seed of $x_0 = 1$, we get the sequence: 7, 17, 23, 1, 7,...
- □ The period is only 4

Washington University in St. Louis

©2017 Raj Jain

Washington University in St. Louis

tp://www.cse.wustl.edu/~iain/cse567-17/

©2017 Raj J

Multiplicative LCG with $m \neq 2^k$

 \square Modulus m =prime number

With a proper multiplier a, period = m-1

Maximum possible period = m

- ☐ If and only if the multiplier a is a *primitive root* of the modulus *m*
- □ a is a primitive root of m if and only if $a^n \mod m \neq 1$ for n = 1, 2, ..., m-2.

Washington University in St. Louis

http://www.cse.wustl.edu/~jain/cse567-17/

26-17

Seed Selection

- Multi-stream simulations: Need more than one random stream
 - ➤ Single queue ⇒ Two streams= Random arrival and random service times
- 1. Do not use zero. Fine for mixed LCGs. But multiplicative LCG or a Tausworthe LCG will stick at zero.
- 2. Avoid even values. For multiplicative LCG with modulus $m=2^k$, the seed should be odd. Better to avoid generators that have too many conditions on seed values or whose performance (period and randomness) depends upon the seed value.
- 3. Do not subdivide one stream.

Example 26.2

$$x_n = 3x_{n-1} \bmod 31$$

□ Starting with a seed of x_0 =1:

1, 3, 9, 27, 19, 26, 16, 17, 20, 29, 25, 13, 8, 24, 10, 30, 28, 22, 4, 12, 5, 15, 14, 11, 2, 6, 18, 23, 7, 21, 1, ...

The period is 30

 \Rightarrow 3 is a primitive root of 31

□ With a multiplier of a = 5: 1, 5, 25, 1,...

The period is only $3 \Rightarrow 5$ is not a primitive root of 31

 $5^3 \mod 31 = 125 \mod 31 = 1$

 \square Primitive roots of 31= 3, 11, 12, 13, 17, 21, 22, and 24.

Washington University in St. Louis

http://www.cse.wustl.edu/~jain/cse567-17/

©2017 Rai Jair

26-18

Seed Selection (Cont)

- 4. Do not generate successive seeds: u_1 to generate inter-arrival times, u_2 to generate service time \Rightarrow Strong correlation
- Use non-overlapping streams.
 Overlap ⇒ Correlation, e.g., Same seed ⇒ same stream
- 6. Reuse seeds in successive replications.
- 7. Do not use random seeds: Such as the time of day. Can't reproduce. Can't guaranteed non-overlap.
- 8. Select $\{u_0, u_{100,000}, u_{200,000}, \ldots\}$

$$x_n = a^n x_0 + \frac{c(a^n - 1)}{a - 1} \bmod m$$

26-21

Myths (Cont)

4. Some seeds are better than others. May be true for some.

$$x_n = (9806x_{n-1} + 1) \mod (2^{17} - 1)$$

- \rightarrow Works correctly for all seeds except $x_0 = 37911$
- > Stuck at $x_n = 37911$ forever
- > Such generators should be avoided.
- > Any *nonzero* seed in the valid range should produce an equally good sequence.
- For some, the seed should be odd.
- > Generators whose period or randomness depends upon the seed should not be used, since an unsuspecting user may not remember to follow all the guidelines.

Washington University in St. Louis

http://www.cse.wustl.edu/~jain/cse567-17/

©2017 Raj Jain

Myths About Random-Number Generation

- 1. A complex set of operations leads to random results. It is better to use simple operations that can be analytically evaluated for randomness.
- 2. A single test, such as the chi-square test, is sufficient to test the goodness of a random-number generator. The sequence 0,1,2,...,m-1 will pass the chi-square test with a perfect score, but will fail the run test ⇒ Use as many tests as possible.
- 3. Random numbers are unpredictable. Easy to compute the parameters, a, c, and m from a few numbers \Rightarrow LCGs are unsuitable for cryptographic applications

Washington University in St. Louis

http://www.cse.wustl.edu/~jain/cse567-17/

©2017 Rai Jain

26-22

Myths (Cont)

- 5. Accurate implementation is not important.
 - > RNGs must be implemented without any overflow or truncation For example,

$$x_n = 1103515245x_{n-1} + 12345 \mod 2^{31}$$

> In FORTRAN:

$$x_n = (1103515245x_{n-1} + 12345).AND.X'7FFFFFFFF'$$

- > The AND operation is used to clear the sign bit
- > Straightforward multiplication above will produce overflow.
- 6. Bits of successive words generated by a random-number generator are equally randomly distributed.
 - > If an algorithm produces *l*-bit wide random numbers, the randomness is guaranteed only when all *l* bits are used to form successive random numbers.

Washington University in St. Louis

http://www.cse.wustl.edu/~jain/cse567-17/

©2017 Raj Jai

Example 26.7

$$x_n = (25173x_{n-1}) \bmod 2^{16}$$

Notice that:		n		x_n	
			Decimal		Binary
(a)	Bit 1 (the least	1	25,173	01100010	01010101
	significant bit) is always	2	12,345	00110000	00111001
	1.	3	54,509	11010100	11101101
b)	Bit 2 is always 0.	4	27,825	01101100	10110001
	•	5	55,493	11011000	11000101
c)	Bit 3 alternates between	6	25,449	01100011	01101001
	1 and 0, thus, it has a	7	13,277	00110011	11011101
	cycle of length 2.	8	53,857	11010010	01100001
d)	Bit 4 follows a cycle	9	64,565	11111100	00110101
´	(0110) of length 4.	10	1945	00000111	10011001
2)	` '	11	6093	00010111	11001101
e)	Bit 5 follows a cycle	12	24,849	01100001	00010001
(11010010	(11010010) of length 8.	13	48,293	10111100	10100101
Washi	ngton University in St. Louis http	://www.cse.w	ustl.edu/~jain/cse56	57-17 <u>/</u>	©2017 Rai Jain

26-25

Summary

- ☐ Pseudo-random numbers are used in simulation for repeatability, non-overlapping sequences, long cycle
- ☐ It is important to implement PRNGs in integer arithmetic without overflow => Schrage's method
- □ For multi-stream simulations, it is important to select seeds that result in non-overlapping sequences
- □ Two or more generators can be combined for longer cycles
- ☐ Bits of random numbers may not be random

St. Louis http://www.cse.wustl.edu/~jain/cse567-17/

©2017 Raj Jain

Example 26.7 (Cont)

- □ The least significant bit is either always 0 or always 1.
- □ The lth bit has a period at most 2^{l} . (l=1 is the least significant bit)
- \Box For all mixed LCGs with $m=2^k$:
 - > The *l*th bit has a period at most 2^{l} .
 - > In general, the high-order bits are more randomly distributed than the low-order bits.
 - \Rightarrow Better to take the high-order l bits than the low-order l bits.
