

# Introduction to OpenFlow

Raj Jain

Washington University in Saint Louis

Saint Louis, MO 63130

Jain@cse.wustl.edu

These slides and audio/video recordings of this class lecture are at:

<http://www.cse.wustl.edu/~jain/cse570-18/>

1. Planes of Networking
2. OpenFlow
3. OpenFlow Operation
4. OpenFlow Switches including Open vSwitch
5. OpenFlow Evolution
6. Current Limitations and Issues

Note: This is the first module of four modules on OpenFlow, OpenFlow Controllers, SDN and NFV in this course.

# Planes of Networking

- ❑ **Data Plane:** All activities involving as well as resulting from data packets sent by the end user, e.g.,
  - Forwarding
  - Fragmentation and reassembly
  - Replication for multicasting
- ❑ **Control Plane:** All activities that are necessary to perform data plane activities but do not involve end-user data packets
  - Making routing tables
  - Setting packet handling policies (e.g., security)
  - Base station beacons announcing availability of services

Ref: Open Data Center Alliance Usage Model: Software Defined Networking Rev 1.0,”

[http://www.opendatacenteralliance.org/docs/Software\\_Defined\\_Networking\\_Master\\_Usage\\_Model\\_Rev1.0.pdf](http://www.opendatacenteralliance.org/docs/Software_Defined_Networking_Master_Usage_Model_Rev1.0.pdf)

# Planes of Networking (Cont)

- ❑ **Management Plane:** All activities related to provisioning and monitoring of the networks
  - Fault, Configuration, Accounting, Performance and Security (**FCAPS**).
  - Instantiate new devices and protocols (Turn devices on/off)
  - Optional ⇒ May be handled manually for small networks.
- ❑ **Services Plane:** Middlebox services to improve performance or security, e.g.,
  - Load Balancers, Proxy Service, Intrusion Detection, Firewalls, SSL Off-loaders
  - Optional ⇒ Not required for small networks

# Data vs. Control Logic

- ❑ Data plane runs at line rate,  
e.g., 100 Gbps for 100 Gbps Ethernet  $\Rightarrow$  Fast Path  
 $\Rightarrow$  Typically implemented using special hardware,  
e.g., Ternary Content Addressable Memories (TCAMs)
- ❑ Some exceptional data plane activities are handled by the CPU  
in the switch  $\Rightarrow$  Slow path  
e.g., Broadcast, Unknown, and Multicast (BUM) traffic
- ❑ All control activities are generally handled by CPU

# OpenFlow: Key Ideas

1. Separation of control and data planes
2. Centralization of control
3. Flow based control

Ref: N. McKeown, et al., "OpenFlow: Enabling Innovation in Campus Networks," ACM SIGCOMM CCR, Vol. 38, No. 2, April 2008, pp. 69-74.

# Separation of Control and Data Plane

- ❑ Control logic is moved to a controller
- ❑ Switches only have forwarding elements
- ❑ One expensive controller with a lot of cheap switches
- ❑ OpenFlow is the protocol to send/receive forwarding rules from controller to switches

# OpenFlow V1.0

- On packet arrival, match the header fields with flow entries in a table, if any entry matches, update the counters indicated in that entry and perform indicated actions

Flow Table:

|               |          |         |
|---------------|----------|---------|
| Header Fields | Counters | Actions |
| Header Fields | Counters | Actions |
| ...           | ...      | ...     |
| Header Fields | Counters | Actions |

|              |              |            |         |               |        |        |          |        |             |             |
|--------------|--------------|------------|---------|---------------|--------|--------|----------|--------|-------------|-------------|
| Ingress Port | Ether Source | Ether Dest | VLAN ID | VLAN Priority | IP Src | IP Dst | IP Proto | IP ToS | Src L4 Port | Dst L4 Port |
|--------------|--------------|------------|---------|---------------|--------|--------|----------|--------|-------------|-------------|

# Flow Table Example

| Port | Src MAC | Dst MAC | VLAN ID | Priority | EtherType | Src IP | Dst IP      | IP Proto | IP ToS | Src L4 Port ICMP Type | Dst L4 Port ICMP Code | Action     | Counter |
|------|---------|---------|---------|----------|-----------|--------|-------------|----------|--------|-----------------------|-----------------------|------------|---------|
| *    | *       | 0A:C8:* | *       | *        | *         | *      | *           | *        | *      | *                     | *                     | Port 1     | 102     |
| *    | *       | *       | *       | *        | *         | *      | 192.168.*.* | *        | *      | *                     | *                     | Port 2     | 202     |
| *    | *       | *       | *       | *        | *         | *      | *           | *        | *      | 21                    | 21                    | Drop       | 420     |
| *    | *       | *       | *       | *        | *         | *      | *           | 0x806    | *      | *                     | *                     | Local      | 444     |
| *    | *       | *       | *       | *        | *         | *      | *           | 0x1*     | *      | *                     | *                     | Controller | 1       |

- ❑ Idle timeout: Remove entry if no packets received for this time
- ❑ Hard timeout: Remove entry after this time
- ❑ If both are set, the entry is removed if either one expires.

# Matching

# Counters

| Per Table      | Per Flow            | Per Port                       | Per Queue               |
|----------------|---------------------|--------------------------------|-------------------------|
| Active Entries | Received Packets    | Received Packets               | Transmit Packets        |
| Packet Lookups | Received Bytes      | Transmitted Packets            | Transmit Bytes          |
| Packet Matches | Duration (Secs)     | Received Bytes                 | Transmit overrun errors |
|                | Duration (nanosecs) | Transmitted Bytes              |                         |
|                |                     | Receive Drops                  |                         |
|                |                     | Transmit Drops                 |                         |
|                |                     | Receive Errors                 |                         |
|                |                     | Transmit Errors                |                         |
|                |                     | Receive Frame Alignment Errors |                         |
|                |                     | Receive Overrun errors         |                         |
|                |                     | Receive CRC Errors             |                         |
|                |                     | Collisions                     |                         |

# Actions

- ❑ Forward to Physical Port  $i$  or to *Virtual Port*:
  - **All**: to all interfaces except incoming interface
  - **Controller**: encapsulate and send to controller
  - **Local**: send to its local networking stack
  - **Table**: Perform actions in the flow table
  - **In\_port**: Send back to input port
  - **Normal**: Forward using traditional Ethernet
  - **Flood**: Send along minimum spanning tree except the incoming interface
- ❑ Enqueue: To a particular queue in the port  $\Rightarrow$  QoS
- ❑ Drop
- ❑ Modify Field: E.g., add/remove VLAN tags, ToS bits, Change TTL

# Actions (Cont)

- ❑ Masking allows matching only selected fields, e.g., Dest. IP, Dest. MAC, etc.
- ❑ If header matches an entry, corresponding actions are performed and counters are updated
- ❑ If no header match, the packet is queued and the header is sent to the controller, which sends a new rule. Subsequent packets of the flow are handled by this rule.
- ❑ Secure Channel: Between controller and the switch using TLS
- ❑ Modern switches already implement flow tables, typically using Ternary Content Addressable Memories (TCAMs)
- ❑ Controller can change the forwarding rules if a client moves  
⇒ Packets for mobile clients are forwarded correctly
- ❑ Controller can send flow table entries beforehand (**Proactive**) or Send on demand (**Reactive**). OpenFlow allows both models.

# Open vSwitch

- ❑ Open Source Virtual Switch
- ❑ Nicira Concept
- ❑ Can Run as a stand alone hypervisor switch or as a distributed switch across multiple physical servers
- ❑ Default switch in XenServer 6.0, Xen Cloud Platform and supports Proxmox VE, VirtualBox, Xen KVM
- ❑ Integrated into many cloud management systems including OpenStack, openQRM, OpenNebula, and oVirt
- ❑ Distributed with Ubuntu, Debian, Fedora Linux. Also FreeBSD
- ❑ Intel has an accelerated version of Open vSwitch in its own Data Plane Development Kit (**DPDK**)

Ref: <http://openvswitch.org/>

Washington University in St. Louis

<http://www.cse.wustl.edu/~jain/cse570-18/>

©2018 Raj Jain

# Open vSwitch Features

- ❑ Inter-VM communication monitoring via:
  - **NetFlow**: Cisco protocol for sampling and collecting traffic statistics (RFC 3954)
  - **sFlow**: Similar to NetFlow by sflow.org (RFC 3176)
  - **Jflow**: Juniper's version of NetFlow
  - **NetStream**: Huawei's version of NetFlow
  - **IPFIX**: IP Flow Information Export Protocol (RFC 7011) - IETF standard for NetFlow
  - **SPAN, RSPAN**: Remote Switch Port Analyzer – port mirroring by sending a copy of all packets to a monitor port
  - **GRE-tunneled mirrors**: Monitoring device is remotely connected to the switch via a GRE tunnel

# Open vSwitch Features (Cont)

- ❑ Link Aggregation Control Protocol (LACP)
- ❑ IEEE 802.1Q VLAN
- ❑ IEEE 802.1ag Connectivity Fault Management (CFM)
- ❑ Bidirectional Forwarding Detection (BFD) to detect link faults (RFC 5880)
- ❑ IEEE 802.1D-1998 Spanning Tree Protocol (STP)
- ❑ Per-VM traffic policing
- ❑ OpenFlow
- ❑ Multi-table forwarding pipeline
- ❑ IPv6
- ❑ GRE, VXLAN, IPSec tunneling
- ❑ Kernel and user-space forwarding engine options

# OVSDB

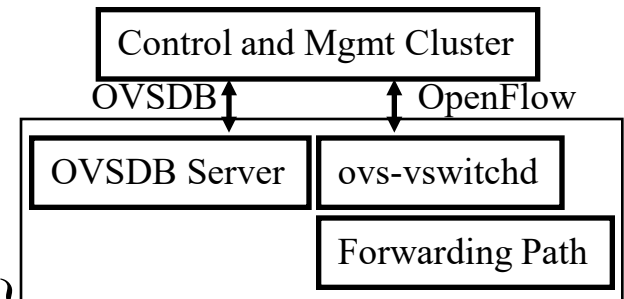

- ❑ Open vSwitch Database Management Protocol (OVSDB)
- ❑ Monitoring capability using publish-subscribe mechanisms
- ❑ Stores both provisioning and operational state
- ❑ Java Script Object Notation (JSON) used for schema format and for JSON-RPC over TCP for wire protocol (RFC 4627)

<database-schema>

“name”: <id>

“version”: <version>

“tables”: {<id>: <table-schema>, ...}

- ❑ RPC Methods: List databases, Get Schema, Update, Lock, ...
- ❑ Open vSwitch project includes open source OVSDB client and server implementations

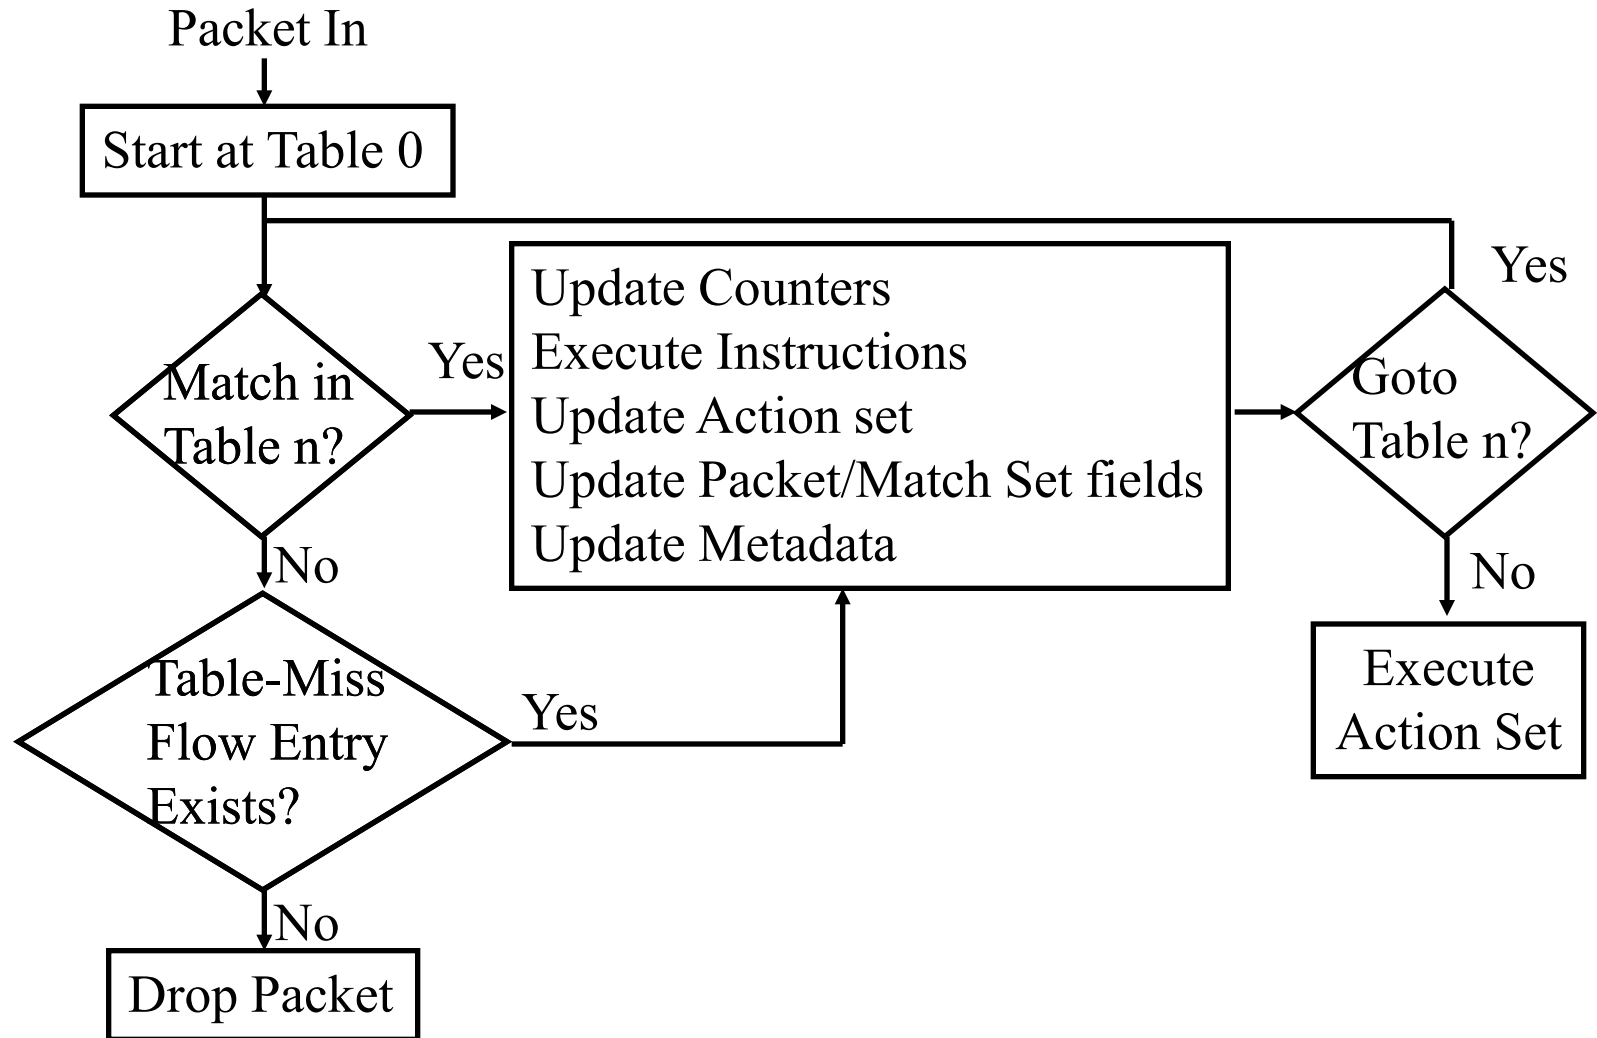

Ref: B. Pfaff and B. Davie, “The Open vSwitch Database Management Protocol,” IETF draft, Oct 2013,  
<http://tools.ietf.org/html/draft-pfaff-ovsdb-proto-04>

# OpenFlow V1.1

- ❑ V1: Perform action on a match. Ethernet/IP only. Single Path  
Did not cover MPLS, Q-in-Q, ECMP, and efficient Multicast
- ❑ V1.1 Introduced *Table chaining*, *Group Tables*, and added *MPLS Label* and *MPLS traffic class* to match fields.
- ❑ **Table Chaining:** On a match, instruction may be
  - Immediate actions: modify packet, update match fields and/or
  - Update action set, and/or
  - Send match data and action set to *Table n*,
  - Go to *Group Table* entry *n*

# OpenFlow V1.1 (Cont)

# OpenFlow V1.1 (Cont)

- ❑ On a miss, the instruction may be to send packet to controller or continue processing with the sequentially next table
- ❑ Group Tables: each entry has a variable number of buckets
  - **All**: Execute each bucket. Used for Broadcast, Multicast.
  - **Select**: Execute one *switch selected* bucket. Used for port mirroring. Selection may be done by hashing some fields.
  - **Indirect**: Execute one *predefined* bucket.
  - **Fast Failover**: Execute the first live bucket ⇒ Live port
- ❑ New Features supported:
  - **Multipath**: A flow can be sent over one of several paths
  - **MPLS**: multiple labels, traffic class, TTL, push/pop labels
  - **Q-in-Q**: Multiple VLAN tags, push/pop VLAN headers
  - **Tunnels**: via virtual ports

Ref: <http://archive.openflow.org/documents/openflow-spec-v1.1.0.pdf>

# OpenFlow V1.2

1. **IPv6 Support:** Matching fields include IPv6 source address, destination address, protocol number, traffic class, ICMPv6 type, ICMPv6 code, IPv6 neighbor discovery header fields, and IPv6 flow labels.
2. **Extensible Matches:** Type-Length-Value (TLV) structure. Previously the order and length of match fields was fixed.
3. **Experimenter extensions** through dedicated fields and code points assigned by ONF

# OpenFlow 1.3

- ❑ **IPv6 extension headers**: Can check if Hop-by-hop, Router, Fragmentation, Destination options, Authentication, Encrypted Security Payload (ESP), unknown extension headers are present
- ❑ **MPLS Bottom-of-Stack bit** matching
- ❑ **MAC-in-MAC** encapsulation
- ❑ **Tunnel ID meta data**: Support for tunnels (VxLAN, ...)
- ❑ **Per-Connection Event Filtering**: Better filtering of connections to multiple controllers
- ❑ Many **auxiliary connections** to the controller allow to exploit parallelism
- ❑ Better **capability negotiation**: Requests can span multiple messages
- ❑ More general **experimenter capabilities** allowed
- ❑ A separate flow entry for **table miss actions**

Ref: <https://www.opennetworking.org/images/stories/downloads/sdn-resources/onf-specifications/openflow/openflow-spec-v1.3.0.pdf>

# OpenFlow V1.3 (Cont)

- ❑ **Cookies:** A cookie field with policy identifier is added to messages containing new packets sent to the controller. This helps controller process the messages faster than if it had to search its entire database.
- ❑ **Duration:** Duration field has been added to most stats. Helps compute rates.
- ❑ Per-flow counters can be disabled to improve performance
- ❑ Per Flow Meters and meter bands
- ❑ **Meter:** Switch element that can measure and control the rate of packets/bytes.
  - **Meter Band:** If the packet/byte rate exceeds a pre-defined threshold  $\Rightarrow$  the meter has triggered the band
  - A meter may have multiple bands

# OpenFlow V1.3 (Cont)

- If on triggering a band the meter drops the packet, it is called rate limiter.
- Other QoS and policing mechanisms can be designed using these meters
- **Per-Flow QoS**: Meters are attached to a flow entry not to a queue or a port.
- Multiple flow entries can all point to the same meter.

New Instruction: Meter Meter\_ID

1. Drop kb/s
2. Remark DSCP Burst

# OpenFlow V1.4

- ❑ **Optical ports:** Configure and monitor transmit and receive frequencies of lasers and their power
- ❑ **Improved Extensibility:** Type-Length-Value (TLV) encodings at most places ⇒ Easy to add new features in future
- ❑ **Extended Experimenter Extension API:** Can easily add ports, tables, queues, instructions, actions, etc.
- ❑ More information when a packet is sent to controller, e.g., no match, invalid TTL, matching group bucket, matching action, ..
- ❑ Controllers can select a subset of flow tables for monitoring
- ❑ Switches can **evict** entries of lower importance if table full
- ❑ Switches can notify controller if table is getting full
- ❑ Atomic execution of a **bundle** of instructions

Ref: <https://www.opennetworking.org/images/stories/downloads/sdn-resources/onf-specifications/openflow/openflow-spec-v1.4.0.pdf>

# OpenFlow V1.4.1

## 1. **Bundle**: Atomic Instruction Group

- A group of instructions from the controller that are either all executed or all not executed
- A bundle may be sent to many switches and then applied at approximately same time on commit request from the controller

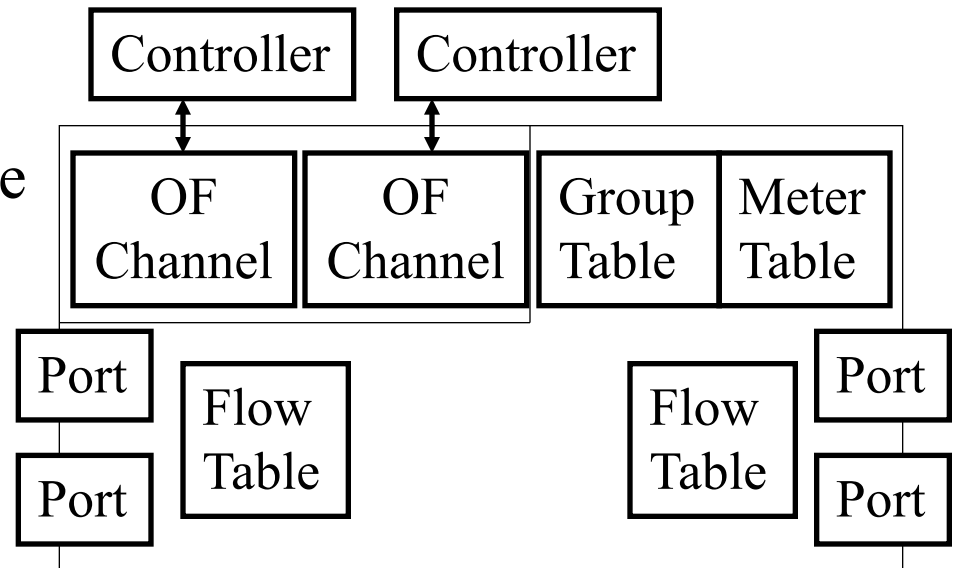

## 2. **Flow Table Monitoring**: Synchronization in a multi-controller system

- Notify a controller if a set of flow table entries is modified by another controller

## 3. Bug fixes

# OpenFlow V1.5

1. **Egress Tables:** actions to be done when exiting through a port (encapsulate or decapsulate a packet, tunnels)
2. **Packet Type:** Can now handle non-Ethernet packets, e.g., IP packets

3. **TCP Flags Matching:** Syn, Ack, and Fin may be used to detect beginning and end of a TCP connection

## OpenFlow V1.5.1: Bug Fixes, March 2015

# OpenFlow Evolution Summary (Cont)

# Bootstrapping

- ❑ Switches require initial configuration: Switch IP address, Controller IP address, Default gateway
- ❑ Switches connect to the controller
- ❑ Switch provides configuration information about ports
- ❑ Controller installs a rule to forward LLDP packets to controller and then sends, one by one, LLDP packets to be sent out to port  $i$  ( $i=1, 2, \dots, n$ ) which are forwarded to respective neighbors. The neighbors send the packets back to controller.
- ❑ Controller determines the topology from LLDP packets
- ❑ LLDP is a one-way protocol to advertise the capabilities at fixed intervals.

Ref: S. Sharma, et al., “Automatic Bootstrapping of OpenFlow Networks,” 19<sup>th</sup> IEEE Workshop on LANMAN, 2013, pp. 1-6, <http://ieeexplore.ieee.org/stamp/stamp.jsp?tp=&arnumber=6528283> (Available to subscribers only)

# OpenFlow Configuration Protocol (OF-Config)

- ❑ **OpenFlow Control Point:** Entity that configures OpenFlow switches
- ❑ **OF-Config:** Protocol used for configuration and management of OpenFlow Switches.  
Assignment of OF controllers so that switches can initiate connections to them:

- IP address of controller
- Port number at the controller
- Transport protocol:  
TLS or TCP
- Configuration of queues  
(min/max rates) and ports
- Enable/disable receive/forward  
speed, media on ports

# OF-Config (Cont)

- ❑ A physical switch = one or more **logical** switches each controlled by an OF Controller
- ❑ OF-Config allows configuration of logical switches.

Ref: ONF, "OpenFlow Management and Configuration Protocol (OF-Config 1.1.1)," March 23, 2013,

<https://www.opennetworking.org/images/stories/downloads/sdn-resources/onf-specifications/openflow-config/of-config-1-1-1.pdf>

# OF-Config Concepts

- ❑ **OF Capable Switch:** Physical OF switch.  
Can contain one or more OF logical switches.
- ❑ **OpenFlow Configuration Point:** configuration service
- ❑ **OF Controller:** Controls logical switch via OF protocol
- ❑ **Operational Context:** OF logical switch
- ❑ **OF Queue:** Queues of packets waiting for forwarding
- ❑ **OF Port:** forwarding interface. May be physical or logical.
- ❑ **OF Resource:** ports, queues, certificates, flow tables and other resources of OF capable switches assigned to a logical switch
- ❑ **Datapath ID:** 64-bit ID of the switch. Lower 48-bit = Switch MAC address, Upper 16-bit assigned by the operator

# OF-Config Evolution

- ❑ V1.0 (Jan 2012): Based on OpenFlow V1.2
  - Assign controllers to logical switches
  - Retrieve logical switch configurations
  - Configure ports and queues
- ❑ V1.1 (May 2012): Based on OpenFlow V1.3
  - Configuration of certificates
  - Capability Discovery: Retrieve logical switch capabilities
  - Configure logical tunnels (VXLAN, NVGRE, ...)
- ❑ V1.1.1 (Jan 2013): Bug Fix. Versioning support
- ❑ V1.2 (2014):
  - OF-Config version negotiation
  - Assigning resources to logical switches

Ref: <https://www.opennetworking.org/images/stories/downloads/sdn-resources/onf-specifications/openflow-config/of-config1dot0-final.pdf>  
<https://www.opennetworking.org/images/stories/downloads/sdn-resources/onf-specifications/openflow-config/of-config-1.1.pdf>  
<https://www.opennetworking.org/images/stories/downloads/sdn-resources/onf-specifications/openflow-config/of-config-1-1-1.pdf>

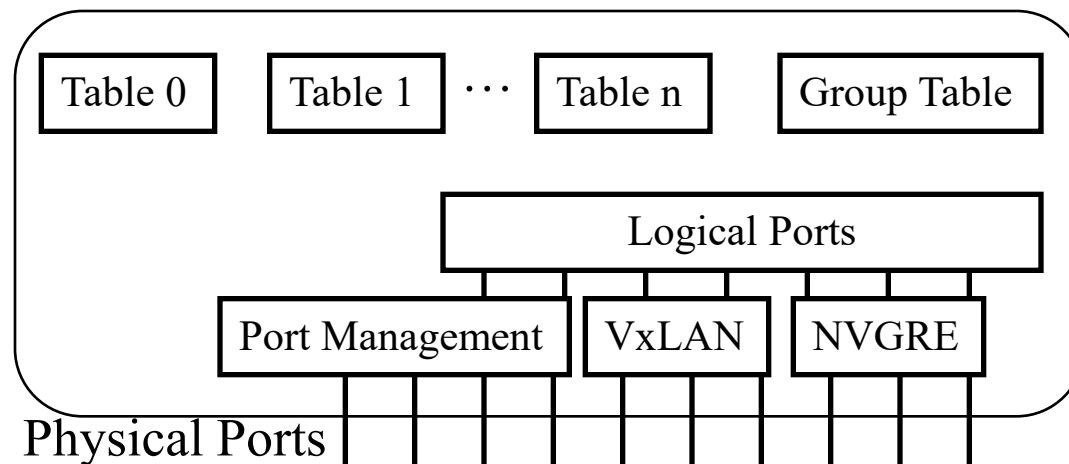

# OpenFlow Notification Framework

- ❑ **Notification:** Event triggered messages, e.g., link down
- ❑ **Publish/subscribe model:** Switch = publisher. OpenFlow controller or OpenFlow config points, and others can subscribe. They will be notified about the events they subscribe.
- ❑ Use **ITU-T M.3702** Notifications: Attribute value change, Communication alarm, Environmental alarm, Equipment alarm, QoS alarm, Processing error alarm, Security alarm, State change, Object creation and deletion
- ❑ **Pre-existing Notifications:** Do not fit in the framework but will be recognized.
  - OpenFlow: Packet-in, Flow removed, Port Status, Error, Hello, Echo request, Echo reply, Experimenter
  - OpenFlow Config: OpenFlow logical switch instantiation, OpenFlow capability switch capability change, Successful OpenFlow session establishment, Failed OpenFlow session establishment, Port failure or recovery

Ref: <https://www.opennetworking.org/images/stories/downloads/sdn-resources/onf-specifications/openflow-config/of-notifications-framework-1.0.pdf>

# Implementation Issues

- ❑ 40+ matching fields in a flow
- ❑ Multiple tables, each with a large number of flow entries
- ❑ Instructions and actions for each table
- ❑ Need VXLAN, NVGRE, etc. support
- ❑ For a large network, flow level programming can take a long time

# Summary

1. Four planes of Networking: Data, Control, Management, Service
2. OpenFlow separates control plane and moves it to a central controller  $\Rightarrow$  Simplifies the forwarding element
3. Switches match incoming packets with flow entries in a table and handle it as instructed. The controller supplies the flow tables and other instructions.
4. Many hardware and software based switches including Open vSwitch
5. OpenFlow has been extended to IPv4, MPLS, IPv6, and Optical Network. But more work ahead.

# Acronyms

- ❑ ACL            Access Control List
- ❑ API            Application Programming Interface
- ❑ ARP            Address Resolution Protocol
- ❑ ASICs          Application Specific Integrated Circuit
- ❑ BFD            Bidirectional Forwarding Detection
- ❑ BUM            Broadcast, Unknown, and Multicast
- ❑ CFM            Connectivity Fault Management
- ❑ CPU            Central Processing Unit
- ❑ DFCA           Dynamic Frequency Channel Allocation
- ❑ DSCP           Differentiated Service Control Point
- ❑ ECMP           Equal Cost Multipath
- ❑ ESP            Encrytec Security Payload
- ❑ FCAPS          Fault, Configuration, Accounting, Performance and Security
- ❑ GRE            Generic Routing Encapsulation
- ❑ ICMP           Internet Control Message Protocol
- ❑ ID              Identifier

# Acronyms (Cont)

- ❑ IDS Intrusion Detection System
- ❑ IEEE Institution of Electrical and Electronic Engineers
- ❑ IETF Internet Engineering Task Force
- ❑ IGMP Internet Group Multicast Protocol
- ❑ IP Internet Protocol
- ❑ IPFIX IP Flow Information Export Protocol
- ❑ IPSec IP Security
- ❑ IPv4 Internet Protocol version 4
- ❑ IPv6 Internet Protocol version 6
- ❑ JSON Java Script Object Notation
- ❑ KVM Kernel-based Virtual Machine
- ❑ LACP Link Aggregation Control Protocol
- ❑ LLDP Link Layer Discovery Protocol
- ❑ MAC Media Access Control
- ❑ MAN Metropolitan Area Network
- ❑ MPLS Multiprotocol Label Switching

# Acronyms (Cont)

- ❑ NFV Network Function Virtualization
- ❑ NVGRE Network Virtualization using Generic Routing Encapsulation
- ❑ OF OpenFlow
- ❑ ONF Open Networking Foundation
- ❑ openQRM Open Qlusters Resource Manager
- ❑ OpenWRT Open WRT54G (Linksys product name) software
- ❑ OSPF Open Shortest Path First
- ❑ OTN Optical Transport Network
- ❑ OVSDB Open vSwitch Database
- ❑ PIM-SM Protocol Independent Multicast - Sparse Mode
- ❑ PIM Protocol Independent Multicast
- ❑ QoS Quality of Service
- ❑ RAN Radio area networks
- ❑ RFC Request for Comments
- ❑ RIP IGMP, IPv6, PIM-SM
- ❑ RIP Routing Information Protocol

# Acronyms (Cont)

- ❑ RPC Remote Procedure Call
- ❑ RSPAN Remote Switch Port Analyzer
- ❑ SDN Software Defined Network
- ❑ SPAN Switch Port Analyzer
- ❑ SSL Secure Socket Layer
- ❑ STP Spanning Tree Protocol
- ❑ TCAM Ternary Content Addressable Memory
- ❑ TCP Transmission Control Protocol
- ❑ TLS Transport Level Security
- ❑ TLV Type-Length-Value
- ❑ ToS Type of Service
- ❑ TTL Time to Live
- ❑ TTP Table Typing Patterns
- ❑ UDP User Datagram Protocol
- ❑ VLAN Virtual Local Area Network
- ❑ VM Virtual Machine
- ❑ VxLAN Virtual Extensible Local Area Network
- ❑ WG Working Group
