- 1. Vehicular Ad-Hoc Networks (VANET):
  Architecture, Applications, Requirements, Routing
- Dedicated short Range Communication (DSRC) and Wireless Access for Vehicular Environment (WAVE)
  - > Spectrum
  - Protocol Components
  - > PHY, MAC
  - Products

#### Vehicular Ad-Hoc Networks (VANET)

- Dynamic Topology with nodes moving at a fast speed
- More processing power, storage, and energy than handhelds
- Location based information: Accidents ahead
- Delay constraint
- Varying environments: City streets with tall buildings vs. open high-way roads
- Sensors: GPS, Speed, Proximity, engine sensor, etc.

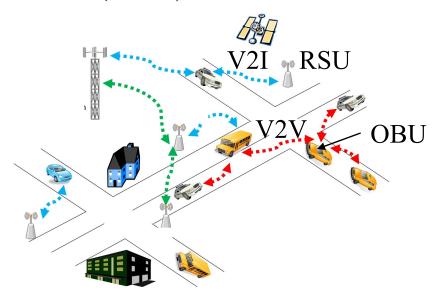

Ref: R. Aquino-Santos, A. Edwards, and V. Rangel-Licea, "Wireless Technologies in Vehicular Ad-Hoc Networks," IGI Global, Feb 2012, 382 pp., ISBN:1466602090, Safari Book.

Washington University in St. Louis

#### **VANET Architectures**

- □ Vehicle to Infrastructure (V2I)
- □ Vehicle to Vehicle (V2V)
- Road-Side Unit (RSU)
- On-Board Unit (OBU)

Ref: R. Aquino-Santos, A. Edwards, and V. Rangel-Licea, "Wireless Technologies in Vehicular Ad-Hoc Networks," IGI Global, Feb 2012, 382 pp., ISBN:1466602090, Safari Book.

Washington University in St. Louis

### **Applications**

- □ Infotainment: Entertainment + Navigation + Telecom
  - > Minimize driver distraction: Bluetooth, Voice recognition
- □ Traffic Control: Reduce congestion and fuel consumption
  - > Highway advisory radio about congestion
  - > Warn before dangerous curves, road conditions
  - Navigation based on congestion
- Safety: Car crashes are major cause of deaths of children aged 5 and above.
  - Adaptive Cruise Control: Maintain a distance from vehicle ahead
  - > Forward Collision Warning: Warn and automatically activate brakes
  - > Speed Regulation: Maintain speed limit

## Requirements

- □ Highly Critical Messages: Warnings about collision require low delay (20 ms), Electronic Toll collection (50 ms), roadside service locator (500 ms)
- Non-Critical: Video entertainment
- □ Short Range: <300 ft
- Mobility
- □ Security: Denial of service, Impersonation, Privacy (location, ID, e-payment), tempering (change sensor readings)

# **Security Requirements**

- Collaboration: Multi-hop communication
- Autonomy: Vehicles should be able to reject participation or a message
- Authentication: Originator and/or location
- Accountability: Messages that impact network functions should be audited. Deliberate disruption could be penalized.
- □ Privacy: Location, name of driver, vehicle type, etc should not be disclosed
- Availability: Vehicles should be usable even if the network is down

### **Routing Types**

- Broadcast: Traffic, weather, emergency, road conditions, ...
- □ Geocast: Within an area. Accidents.
- Forwarding: Point-to-point via multi-hop
- Clustering: Within a specified group. Police, Fire, Safety,
- Beaconing: Periodic exchange of information. Receivers integrate received info with their own and beacon.
- Position Based: Geographical routing based on positions of routers
- Delay-Tolerant: Stored and forwarded when another car is seen.
- Ad-Hoc: Address based mobile ad-hoc network routing

## VANET Technologies

- □ Dedicated Short Range Communication (DSRC): IEEE 802.11p, IEEE 1609.1-4
   Up to 1km at 200 km/h
- WiMAX: Better for long distance. V2I
- □ 3G: Seamless handoff, high latency
- Satellite: Ubiquitous. High Cost. Large propagation delay.

### **DSRC Spectrum**

- Dedicated short-range communications (DSRC) band allocated by FCC: 5.850-5.925 GHz: Seven 10-MHz channels
- Seven 10 MHz channels in 5.9 GHz band
- □ Channel 178 used as Control Channel (CCH)
- □ Channels 174, 176, 180, 182 used as service channels (SCH)
- □ Channel 184 is reserved for future High Availability Low Latency (HALL)
- □ Channel 172 is unused
- □ Different EIRP for 4 Classes: A/B: 23 dBm, C:33 dBm, D: 43dBm (Govt), 33 dBm (others)

### **DSRC Protocol Components**

Management Plane Data Plane UDP/TCP WAVE Short Message WAVE Management TCP not advised Entity (WME) Protocol (WSMP) Service Entity (WSE) IEEE 1609.3/1609.4 **ASTM E17.51** IPv6 Only Logical Link Layer (LLC) IEEE 802.2 EEE 1609.2 MLME Extension WAVE MAC Layer IEEE 1609.4 IEEE 1609 3/1609 4 **WAVE Security** MAC Layer Management Entity (MLME) IEEE 802.11 Physical Layer WAVE PHY Layer Management Entity (PLME) IEEE 802.11p IEEE 802.11p http://www.cse.wustl.edu/~jain/cse574-14/ Washington University in St. Louis ©2014 Rai Jain

### **DSRC Protocol Components (Cont)**

- Wireless Access for Vehicular Environment (WAVE)
- WAVE Short Message Service (WSMP): ASTM E17.51 Packets contain Priority, data rate, and power (how far should it go). Developed by American Society for Testing and Materials (ASTM) E17.
- WAVE Management Entity (WME): IEEE 1609.3 and IEEE 1609.4
   Registers Priority, data rate, and power for different applications
- WAkey2lst1VE Security Entity (WSE): IEEE 1609.2 Data Encryption and Key management

### **IEEE 802.11p PHY**

- A Variation of IEEE 802.11a 5.8 GHz PHY
- □ OFDM with 64 subcarriers is used in 10 MHz
  - > 48 data, 4 pilots, and 12 guard subcarriers as in 802.11a
  - > Subcarrier spacing is half of that in 802.11a
  - > All time parameters are doubled
  - > Symbol size is twice of that in 802.11a
  - > Guard Interval is also twice of that in 802.11a
    - ⇒ Allows larger multi-path delay spread
  - > Data rate is half of that in  $802.11a \Rightarrow 27$  Mbps max

# IEEE 802.11p PHY (Cont)

Parameter	<b>IEEE 802.11a</b>	<b>IEEE 802.11p</b>
Frequency Band	5.8 GHz	5.9 GHz
FFT Size	64	64
Number of Subcarriers	64	64
Data Subcarriers	48	48
Pilot Subcarriers	4	4
Channel Width	20 MHz	10 MHz
Symbol Duration	4 us	8 us
Guard Time	0.8 us	1.6 us
FFT Period	3.2 us	6.4 us
Preamble	16 us	32 us

#### **DSRC** Devices

- Two Channels: Control channel (CCH) for safety messages and network control. Service channel (SCH) for all other messages
- □ All devices use CCH and one or more SCH
- Two types of devices:
  - > Multi-Channel: Can use CCH and SCH continuously
  - > Single Channel: Single Radio for both CCH and SCH
    - ⇒ Need time to switch between two channels
    - ⇒ Guard time between switching
- All devices must monitor CCH for a common CCH Interval All devices should synchronize clocks to UTC time Generally RSU's will have GPS clocks and transmit it in their beacons
- WAVE Basic Service Set (WBSS): Set of stations in one 802.11p network
- Neighboring WBSS use different Service Channels

## WAVE QoS

- Two types of traffic: IPv6 and WSM. No IPv4 because of address issues
- WSMP packets contain channel #, data rate, power level and priority
- □ IPv6 streams need to inform MLME about their profile that includes channel #, data rate, and power level
- □ IEEE 802.11e is extended to support 4 queues for each channel
- Channel Router: Directs the packet to the right channel and queue
- □ Channel Selector: Monitors channels and schedules transmission with the specified power and data rate

#### **802.11p Channel Coordination Function**

#### **WBSS Formation**

- Any WAVE device can start a WBSS when requested by an application.
- □ Provider: Device that starts WBSS (OBU or RSU). Generates announcements.
- Users: Devices that join WBSS
- Persistent WBSS: Announced every sync interval
- Non-Persistent WBSS: Short lived. Announced at formation only, e.g., to support on-demand file download
- □ Server applications register with WME with a Provider Service Identifier (PSID) like port numbers.
- □ A WBSS is initiated when first application registers.
- □ The Provider Service Table (PST) is broadcast periodically

#### **WBSS Formation (Cont)**

- User applications register their interests with their WME.
- WME monitors announcements and check to see if PST of a WBSS is of interest.
- □ PBSS are shutdown when there is no active application

#### **Non-WBSS Communication**

- □ Outside the context of a BSS (OCB) Mode:
  - > Stations do not have to be a member of a BSS to transmit
  - > A WAVE device can send a WSMP message to a broadcast address on CCH
  - Another WAVE device can respond to this WSMP message on the CCH
  - > No BSS advertisement or synchronization
  - > Timing Advertisements from provider: Default parameter values and a timestamp indicating local time
  - Authentication handled by higher layers
- □ OCB stations use slightly higher AIFS than WBSS members.
- OCB stations use wild card in the BSS ID field in MAC frames

## 802.11p Products

- Arada Systems: OBU and RSU
- □ Cohda Wireless: WAVE-DSRC Radio
- NXP: Software Defined Radios for Cohda's radios
- Unex: OBUs
- □ Ittiam: HDL implementation (IP)
- Card Access Engineering: Product designs
- □ LITEPOINT: Test platform
- Rohde & Schwarz: Spectrum analyzers and signal generators

**OBU** 

**RSU** 

Radio

#### **Future**

- □ DSRC is designed for short range communication
- Good for the city but long-range communication is also required on highways using cellular technology
- □ Will require multi-channel OBUs

#### **Summary**

- 1. VANETs have a dynamic topology, very tight delay constraint for critical messages. V2V and V2I Communication between RSU and OBU.
- 2. DSRC uses 10MHz Channels with OFDM in 5.9 GHz. CCH for Control and safety critical messages. SCH for all other messages.
- 3. ASTM started WAVE with WAVE Short message Service Protocol. IEEE 1609.1-4 standards extended 802.11 MAC management and security for DSRC.
- 4. IEEE 802.11p PHY OFDM is similar to 802.11a but with double symbols durations.
- 5. QoS similar to IEEE 802.11e but four queues for each channel.
