Project Proposal and Presentation Requirements

Your project proposal and presentation should include the following parts:

1. Group formation:
   a. Group members’ names, student IDs and email addresses

2. Project description:
   a. Purpose and target users
   b. Core Features: these are the critical and major features of your app that fulfill its primary purposes. These functions will be used as the major metrics to evaluate the completion of your app. For example, if you are developing an instant messaging app, then user management and messaging should be included in core functions. To receive full credit for the Update Presentation, these features should be completed before that.
   c. Additional Features: these are not the necessary features for the app’s main purpose, but can improve user experience and make the app stand out from other similar ones. In the instant messaging app example, being able to block users would be an additional feature. In the final presentation, the additional features will make up a significant part of your grade.
   d. R&D Features: this is a place for you to list advanced functions that you are not sure whether you can achieve. Completing these features will give you extra credits that you can use to compensate points you lost in other parts. This part can be empty. You will get extra credit for the final presentation if you complete any features in this part.

After your submission to Github classroom, we will review each proposal to make sure that your project proposal demonstrates the level of complexity for a 400-level CS course and involves significantly more work than CSE 438 final project. We may make additional requirements if we consider your project too simple compared to others.

Also, we will consider the number of people in your group when we review your project proposal. In other words, we would not expect teams with fewer people to have the same workload as a full 4-people team.
